Understanding and evaluating psychological tests

- Concept designed for the Bachelor in Psychology
- Test theory, development and evaluation in one volume
- Concept maps provide a structure for the complex subject matter

Theory, planning and controlling tests is a crucial field of knowledge that will be covered on the exam of psychology studies. It is also indispensable for later real life to be able to deploy tests correctly and to evaluate their results appropriately. This book provides students with an understandable and well-founded introduction into the criteria of scientific test quality, test development and item construction, classic and probabilistic test theory, test evaluation and interpretation of test results. In-depth chapters describe the deployment of statistics software, the execution of factor analyses and much more.

Complete with key terms in the marginalia column,
definitions, summaries and control questions absolutely suitable for exam preparation!

The author
Dr. Markus Pospeschill, academic senior counsellor, teaches and does research in psychology and the Saarland University in the fields of research methods and methodology and psychodiagnostics.
